¹⁸F-FDG WHOLE BODY PET-CT STUDY

Patient Name: SAROJ BHATT		Age/Sex: 42Y/F
Study ID: FDGN/37071/24	UHID: 106925475	Date: 08.10.2024

Indication: K/C/O metastatic Ca right breast, post chemotherapy (last on 29.11.23)- currently on pertuzumab and trastuzumab (last 29.9.24). FDG PET/CT for response evaluation.

Procedure: PET-CT acquisition was done 60 minutes after injection of 10 mCi ¹⁸F-FDG by intravenous route, from the level of orbits to mid-thigh. CT was done for attenuation correction and anatomical localization.

PET-CT Findings:

Head and Neck: FDG avid subcentimetric level VII lymph node is noted (measuring ~9 x 8 mm) – new finding. Few non FDG avid subcentimetric left supraclavicular lymph node are noted – no interval change. Increased FDG uptake noted in bilateral palatine tonsils with few non FDG avid sub-centimetric bilateral cervical level II, III, V lymph nodes – infective/inflammatory. Visualized paranasal sinuses, skull base, pharynx, larynx and thyroid do not show any abnormality on CT.

Thorax: FDG avid spiculated lesion (measuring ~2.4 x 1.5 cm) is noted in lower quadrant of right breast, reaching upto the overlying skin. Fat planes with underlying muscles are preserved – interval increase in size. FDG avid soft tissue density nodules are noted in lower lobe of right lung (2.1 x 2.0 cm) and upper lobe of left lung (8 x 6mm) – new finding. Left breast is unremarkable. Few mildly FDG avid subcentimetric bilateral axillary level I and II lymph nodes are noted. Few FDG avid paratracheal, AP window, subcarinal and bilateral hilar lymph nodes noted – likely reactive, status quo.

Abdomen-Pelvis: Mildly FDG avid subcentimetric ileo-cecal lymph nodes noted – likely infective. Other non FDG avid mesenteric, retroperitoneal and external iliac lymph nodes are also noted. Uterus appears bulky. Non FDG avid right adnexal cyst is noted (4.7 x 4.1 cm) -benign. Normal FDG distribution is noted in the liver, spleen, kidneys, gastrointestinal tract and urinary bladder. Liver, biliary ducts, gall bladder, spleen, kidneys, stomach, adrenals, pancreas bowel and urinary bladder appear normal on CT. No ascites is noted.

Musculo-Skeletal System: Mildly FDG avid lytic sclerotic lesion is noted in the body of sternum – interval decrease in avidity. Physiological FDG uptake is seen in the visualized axial and appendicular skeleton- reactive.

IMPRESSION:

- Metabolically active right breast lesion with bilateral lung nodules – residual disease.
- As compared to previous PET/CT (FDG/28555/24, 12.03.2024); there is increase in size of primary right breast lesion with appearance of new lung nodules – progressive disease.
